

BUILDING BLOCK ELEMENT

ABSTRACT

5 A building block element has a pair of long sides, a pair of short sides
and a thickness. The long sides and short sides have a length at least one or
multiple times of the thickness. The long sides or short sides have at least
one notch. The element also may have a slot in the center. The slot has a
long side and a short side at a length at least one time of the thickness.
Based on the long sides, short sides, and thickness of the building block
10 element, and variations of the shape and location of the slot, different shapes
of building blocks may be built.
